Statistical Release

CSD Release No. 07/2025 12th December, 2025.

Tuvalu Vitals Statistics Release

(Mid-Year Report for 2025)

Introduction

This Vital Statistics Release provides a summary of live births and deaths recorded in Tuvalu, using Health Department data from 2018 to the first half of 2025. The report presents key demographic indicators including birth trends, mortality patterns, sex ratios, and infant mortality rates to support evidence-based planning and decision-making.

By comparing current mid-year results with long-term trends, the release highlights important changes in fertility, mortality, and island-level population dynamics. The aim is to offer clear and timely insights into Tuvalu's population health and to strengthen ongoing demographic monitoring.

Executive Summary

This mid-year 2025 Vital Statistics Release presents a summary of live births and deaths recorded in Tuvalu from January to June 2025, with comparisons to trends from 2018 onward. A total of 99 live births were registered in the first half of 2025, showing a modest 1% increase from 2024. The sex ratio at birth declined to 90 males per 100 females, while births remained concentrated on Funafuti (97%). Mothers aged 30-34 years accounted for the highest share of births, with low levels of teen pregnancies and a continued rise in low-birthweight infants (9%).

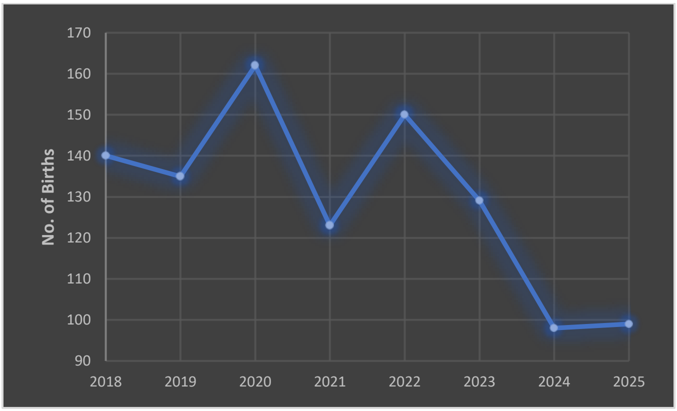
A total of 43 deaths were recorded during the same period, representing a 9% decrease from the previous year. Mortality remained highest among the elderly age groups, though an elevated number of deaths among children aged 0-4 years was noted. Funafuti accounted for 79% of all deaths, reflecting its central health services role. The natural increase remains positive but continues to narrow over time. The infant mortality rate for the first half of 2025 stands at 21 deaths per 1,000 live births, with male infants experiencing higher mortality.

These findings provide a timely overview of Tuvalu's population dynamics and support ongoing planning and policy efforts in the health and social sectors.

1. Births

1. *Comparisons of Births First Half Trends*

Figure 1: Birth trends for the first-half for the period between 2018 – 2025



- The first half of 2022 recorded the highest number of live births, with 162 births.
- Births fluctuated between 2018 and 2023, followed by a sharp decline in 2024 to 98 births - the lowest level in the eight-year period.
- In the first half of 2025, 99 births were recorded, representing a modest 1% increase from the same period in 2024.

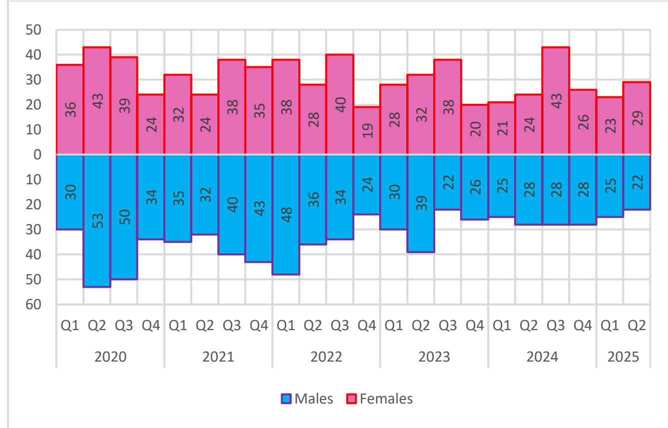
2. *Quarterly Births Averages*

Table 1: Average quarterly and annual births by Sex for the Years 2018– 2024

	Males	Females	Total
Q1	34	30	**64**
Q2	38	31	**70**
Q3	36	35	**72**
Q4	30	25	**55**
Total	**140**	**121**	**261**

- Across 2018–2024, male births peak in Q2 with an average of 38, while female births peak in Q3 with an average of 35.
- Male births average about 140 per year, compared to 121 for females.
- Quarterly births are highest in Q3, averaging 72 births, contributing to an overall annual average of approximately 261 births.

Figure 2: Total quarterly live births (Q1 2020 – Q2 2025)



- The highest quarterly total in the five-year period was Q2 2020, with 96 live births - 26 above the Q2 average of 70.
- Q2 2020 also recorded the highest male (53) and female (43) births, a pattern matched again in Q3 2024.
- The lowest quarterly total was Q4 2022, with 43 live births - 12 below the Q4 average of 55.

3. *Sex Ratio at Birth*

Table 2: Total live births by Sex from 2018 to 2024, with the first half of 2025.

	Males	Females	Total	Sex Ratio
2018	136	121	**257**	112
2019	157	99	**256**	159
2020	167	142	**309**	118
2021	150	129	**279**	116
2022	142	125	**267**	114
2023	117	118	**235**	99
2024	109	114	**223**	96
2025	47	52	**99**	90

The Sex Ratio indicates the number of Males per 100 females, the results show that;

- Before 2022, male births consistently exceeded female births.
- In 2023, female births surpassed male births, resulting in a sex ratio of 99 males per 100 females.
- By 2025, the sex ratio declined further to 90 males per 100 females, falling below the natural global range of 103-107.

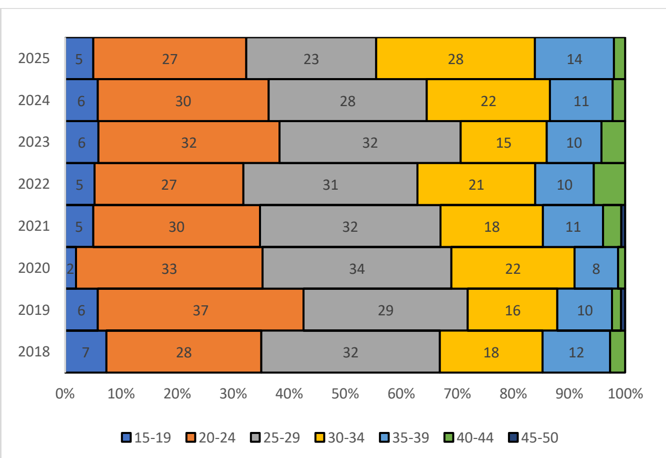
Figure 3: Sex proportion of live births (2018 – Q2 2025)

	2018	2019	2020	2021	2022	2023	2024	2025 (1st half)
Female %	47	39	46	46	47	50	51	53
Male %	53	61	54	54	53	50	49	47

- In 2019, proportion of male births peaked to 61% of total births.
- Since 2020, the share of male births has declined while female births increased.
- By 2023, births were evenly split between sexes, but in the first half of 2025, females accounted for 53% of births.

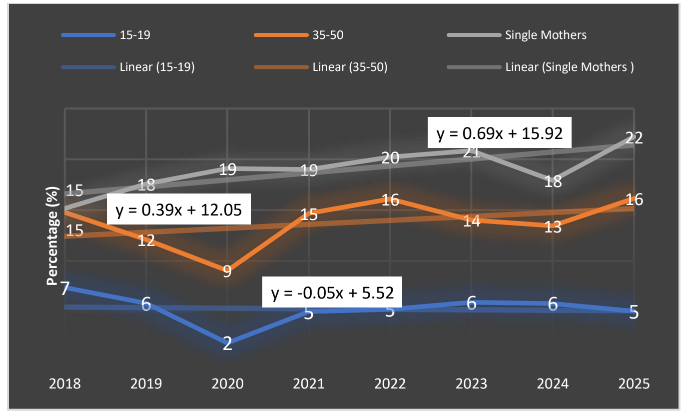
4. Births by Age Group of Mothers & Marital Status

Figure 4: Proportion of Mothers Age-Group (2018– 2025)



- Mothers aged 25-29 consistently led births from 2018-2022, but 30-34 became the dominant group in the first half of 2025, reflecting a shift toward older maternal age.

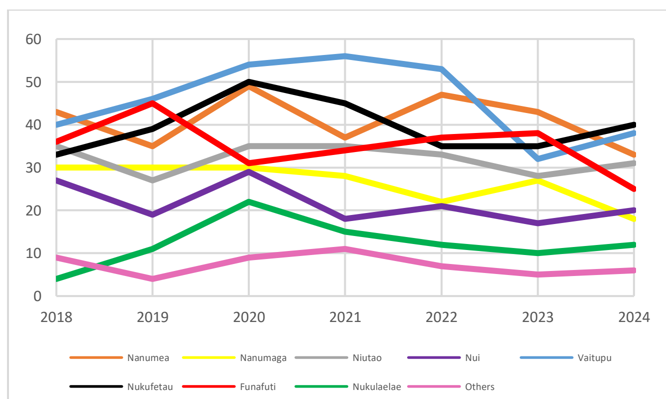
Figure 5: Key Statistics on Mothers



- **Teen pregnancy** remains low (averages around 5%) and show a slow downward trend (-0.05% per year) possibly linked to strengthened awareness and education.
- Births to **Mothers age 35+ years** shows a steady rise (0.39% each year), which may have implications for obstetric care and maternal health planning.
- The proportion of births to **Single mothers** has increased gradually, rising by roughly 0.7% points per year.

5. Home Island of Mothers

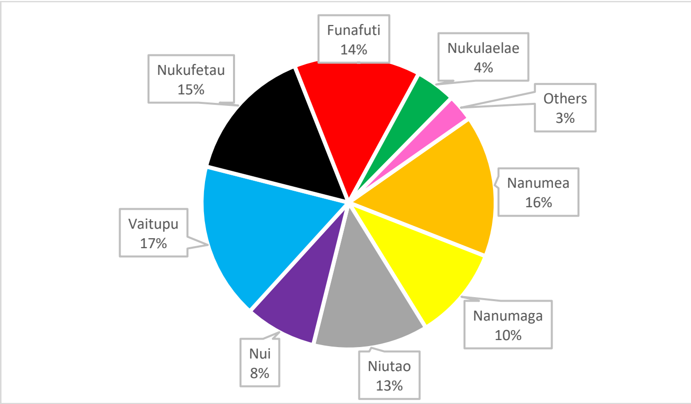
Figure 6: Trends of Mothers home-islands, 2018-2024



Trends in mothers' home islands (2018-2024) include:

- Mothers from Vaitupu recorded the highest births in 2021 with 56, followed by a sharp 40% decline to 32 births in 2023.
- Births from Nanumea, Nui, Nukufetau, and Nukulaelae peaked in 2020.

Figure 7: Average share of Mothers Home Islands for the period 2018 to the first-half of 2025

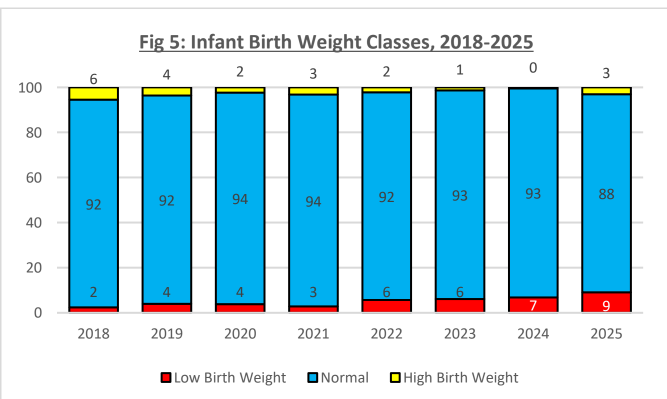


From 2018 to the first half of 2025:

- Vaitupu remained the largest contributor of mothers, averaging 17%, followed by Nanumea at 16%.
- Mothers from foreign countries accounted for the smallest share, averaging 3% over the eight-year period.

6. Newborn Weight Distribution

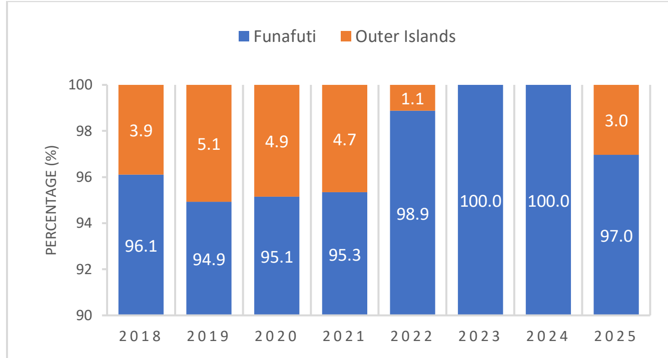
Figure 8: Infant Birth Weight Classes (2018 – 2025)



- Low birthweight (<1.5kg) increased from 2% in 2018 to 9% in the first half of 2025, indicating a rising public health concern.
- High birthweight (≥4.5kg) has declined since 2018 but slightly increased again in 2025.

7. Island of Birth

Figure 9: Proportion of births occurring on Funafuti vs Outer islands

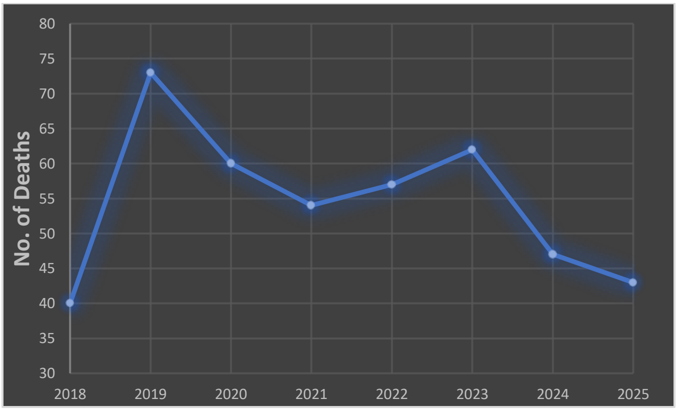


- Almost all births occur on Funafuti, especially in 2023 and 2024 where no outer-island births were recorded.
- In the first half of 2025, only 3% of recorded births occurred in the outer islands.
- Outer island facility constraints and inter-island mobility likely influence patterns.

2. Mortality

1. Comparisons of Mortalities First Half Trends

Figure 10: Mortality trends for the first-half for the period between 2018 – 2025



- The highest first-half mortality occurred in 2019, with 73 deaths, representing an 83% increase from the 2018 low of 40 deaths.
- Following the 2019 peak, mortality showed a two-year decline in 2020 and 2021, a moderate rise in 2022 and 2023, and then fell again in both 2024 and 2025.
- In the first half of 2025, a total of 43 deaths were recorded, marking a 9% decrease compared with the same period in 2024.

2. Quarterly Mortality Averages

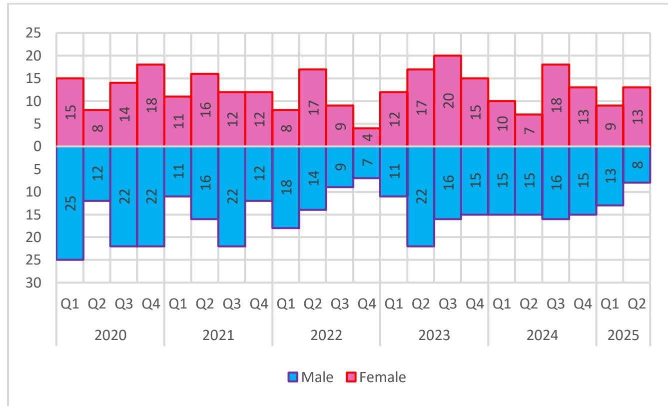
Table 3: Average quarterly and annual deaths by Sex for the Years 2017– 2024

	Males	Females	Total
Q1	16	12	**28**
Q2	16	13	**30**
Q3	15	15	**30**
Q4	16	13	**28**
Total	**63**	**53**	**116**

In the 8-year period between 2017 and 2024;

- Male deaths average 16 per quarter, except in Q3, where they dip slightly to 15, while female deaths peak in Q3, matching male levels.
- Annually, males average 63 deaths, compared with 53 deaths for females.
- Quarterly mortality is highest in Q2 and Q3, averaging around 30 deaths, contributing to an overall annual average of approximately 116 deaths.

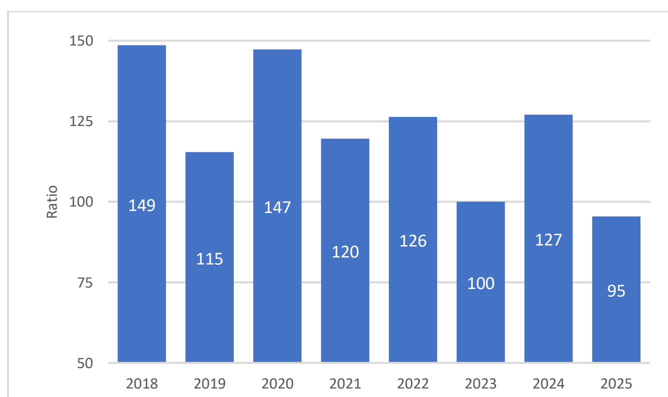
Figure 11: Total quarterly deaths (Q1 2020 – Q2 2025)



- Deaths in Q2 2025 declined by 8.5% compared with Q2 2024.
- The highest quarterly mortality in the six-year period occurred in Q1 and Q4 of 2020, each recording 40 deaths.
- The lowest quarterly total was Q4 2022, with only 11 deaths.
- Q2 2025 shows an atypical pattern, with female deaths (13) exceeding male deaths (8), contrary to historical trends.

3. Mortality Sex Ratio

Figure 12: Mortality Sex Ratio from 2018 to 2024, with the first half of 2025.



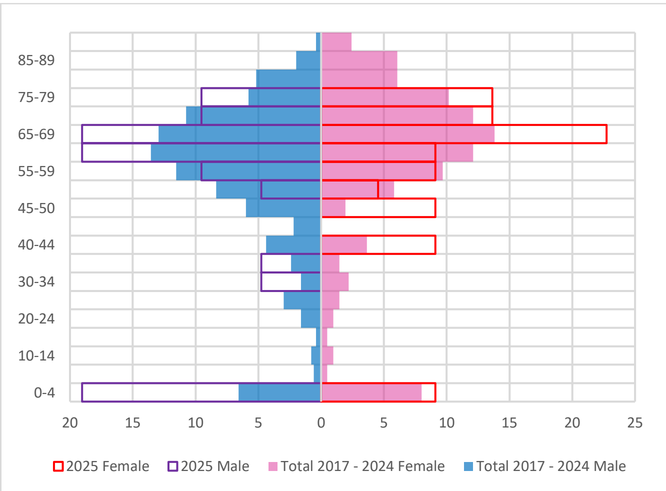
Mortality sex ratio = Male deaths per 100 female deaths

- Since 2018, there have been more male deaths compared to females, with 2019 recording the highest male deaths of about 149 per 100 female deaths.

- In 2023, male deaths were equal to females, but in the first half of 2025, the ratio decreased to 95 male deaths to 100 female deaths.

4. Deaths by Age Group and Sex

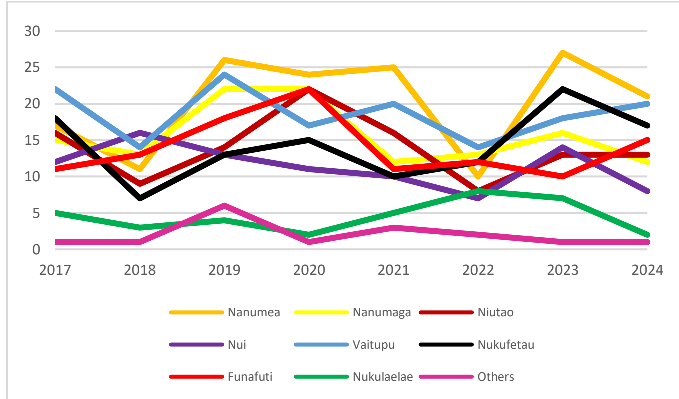
Figure 13: Comparison of percentage deaths by age-group and sex in the first-half of 2025, to the aggregate percentage deaths from 2017 to 2024



- Mortality patterns from 2017–2024 peak among the elderly, with males aged 60–64 and females 65–69 each accounting for 14% of deaths.
- In the first half of 2025, elderly mortality remained high, reaching 19% for males (60–69 years) and 23% for females aged 65–69.
- Young children aged 0–4 show concerning mortality levels, averaging 7% (males) and 8% (females) across the years; in early 2025, male child mortality rose sharply to 19%, with females at 9%.
- Working-age mortality (15–49 years) remains low overall, though the 40–44 age group shows a 4% spike in aggregate data; in 2025, female deaths in this group increased to 9%, while male deaths were highest among those aged 30–39 (around 5% each).

5. Deaths by Home Island

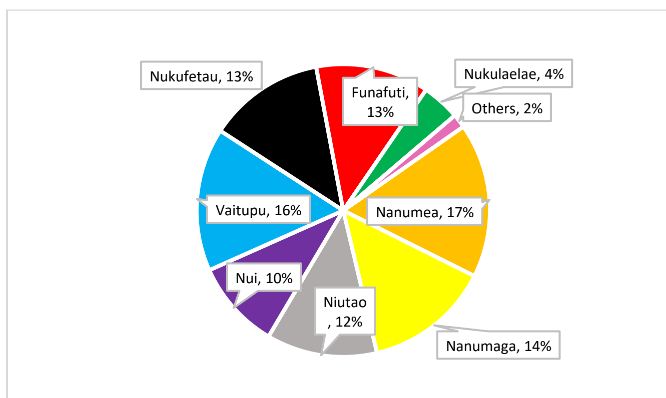
Figure 14: Mortality trend by Home-island from 2017–2024.



Trends in home islands of recorded deaths (2017–2024) include:

- Nanumea recorded the highest deaths in 2023 with 27, a sharp 170% increase from its lowest of 10 in 2022.
- In 2019 and 2020, most islands-including Nanumaga, Niutao, Vaitupu, Funafuti-and recorded deaths of foreigners reached their peak.

Figure 15: Average recorded deaths per Home Islands for the period 2018 to the first-half of 2025

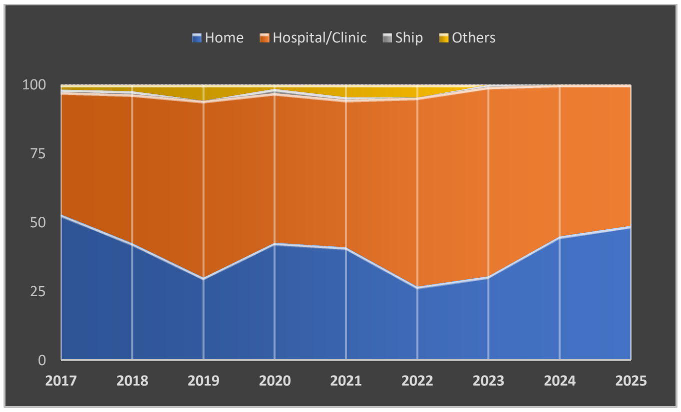


From 2017 to the first half of 2025:

- Nanumea accounted for the largest share of deceased, averaging 17% per year, followed by Vaitupu at 16%.
- Deaths of individuals from foreign countries represented the smallest share, averaging 2% per year over the nine-year period.

6. Place of Death

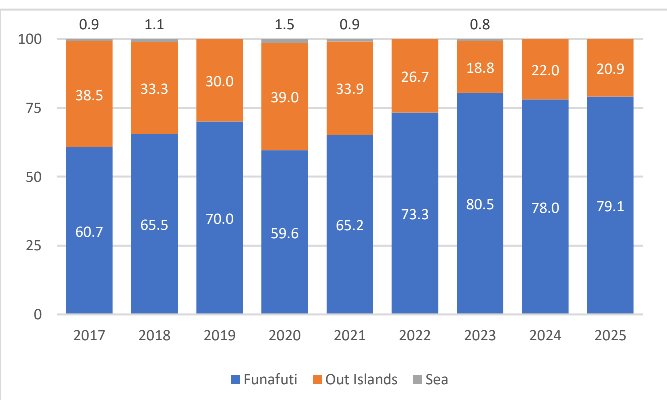
Figure 16: Proportion of Reported Place of Deaths 2017-2025



- In 2017, more deaths occurred at home (53%) than in hospitals or clinics (44%).
- The highest hospital or clinic deaths were recorded in 2022 and 2023, accounting for 69% of deaths
- In 2024 and the first half of 2025, the proportion of home deaths increased, indicating potential limited access to healthcare or late presentation to health facilities.

7. Deaths by Island of Occurrence

Figure 17: Proportion of Deaths for Funafuti and Out Islands from 2017-2025

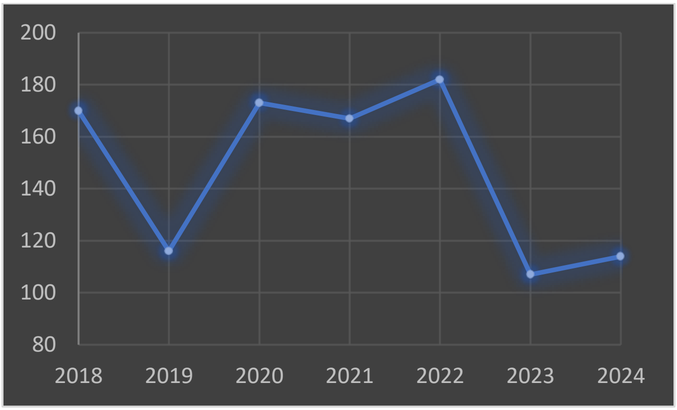


- Most deaths occur in Funafuti, averaging 70.2% per year, with outer islands accounting for 29.2%.
- In 2020, deaths in Funafuti dropped to a low of 59.6%, while deaths in outer islands and at sea reached their highest at 39% and 1.5%, respectively.
- Since 2020, deaths in Funafuti have gradually increased, reaching 79.1% in the first half of 2025, compared to 20.9% in the outer islands, reflecting Funafuti's central role in treating critical cases deferred from outer islands.

3. Key Vital Statistics Indicators

1. Natural Increase

Figure 18: Natural Increase trend from 2018- 2024



- Over the past seven years, Tuvalu's natural increase has remained positive, indicating more births than deaths.
- Sharp rises in deaths in 2019 and 2023 caused noticeable dips in the trend.

2. Sex Specific & Total Infant Mortality Rate

Table 4: Infant mortality rate from 2018 to the first half of 2025 disaggregated by Sex;

	Sex Specific IMR		IMR
	Males	**Females**	**Total**
2018	37	33	35
2019	38	71	51
2020	18	42	29
2021	7	16	11
2022	7	8	7
2023	17	17	17
2024	46	18	31
2025	30	13	21

The figures in the table are interpreted as;

- In 2025, the infant mortality rate was 21 deaths per 1,000 live births.
- The rate was higher for male infants (30 per 1,000) compared to female infants (13 per 1,000).
- The higher mortality rate among male infants suggests a gender disparity in infant survival, highlighting the need for targeted maternal and child health interventions.

4. Technical Notes

1. Sex Ratio;

The sex ratio formula calculates the proportion of males to females in a population;

$$Sex\ Ratio = \frac{Number\ of\ Males}{Number\ of\ Females} \times 100$$

representing males per 100 females.

2. Percentage Birth Weight Classes;

Weights were divided into the 5 different weight groups;

Weight Classes	Weight Range
Very Low Birth Weight	< 1.5kg
Low Birth Weight	1.5 - 2.49kg
Normal	2.5 - 4.49kg
High Birth Weight	≥ 4.5kg

$$Weight\ Class\ \% = \frac{Number\ of\ Births\ within\ Range}{Total\ Number\ of\ Births} \times 100$$

3. Infant Mortality Rate;

The infant mortality rate (IMR) formula calculates deaths per 1,000 live births;

$$IMR = \frac{Number\ of\ Infant\ Deaths}{Number\ of\ Live\ Births} \times 1{,}000$$

where infant deaths are babies dying before their first birthday in a specific year and location.
