Statistical Release

CSD Release No. 07/2025 29th October 2026.

Tuvalu Vitals Statistics Release 2025

Introduction

This Vital Statistics Release summarizes live births recorded in Tuvalu from 2018 to 2025 and deaths recorded from 2017 to 2025, using data provided by the Health Department. The report presents key demographic indicators including birth trends, mortality patterns, sex ratios, natural increase and infant mortality rates to support evidence-based planning and decision-making.

By examining trends over the eight-year period, the report highlights important changes in fertility, mortality, and island-level population distribution across Tuvalu. The aim is to offer clear and timely insights into Tuvalu's population health and to strengthen ongoing demographic monitoring.

Executive Summary

This 2025 Vital Statistics Release presents a summary of live births and deaths recorded in Tuvalu from 2018 to 2025. In 2025, a total of 184 live births and 85 deaths were registered, resulting in a natural increase of 99, indicating that births continued to exceed deaths. Female births (101) slightly exceeded male births (83), resulting in a sex ratio of 82 males per 100 females. Most births occurred in Funafuti, while mothers aged 20-29 years accounted for the largest proportion of registered births. The majority of newborns were born within the normal birth weight range, with relatively few classified as low or high birth weight.

Mortality remained higher among males than females, with most deaths occurring in Funafuti and among the older age groups. The Infant Mortality Rate (IMR) in 2025 was 16 deaths per 1,000 live births, showing an improvement compared with previous years.

These findings indicate that Tuvalu continued to experience positive natural population growth, although both births and deaths fluctuated over the reporting period. These statistics provide important evidence to support population planning, health policy, and future demographic monitoring.

1. Births

1. Comparisons of Annual Births Trends

Figure 1A: Total Annual Births 2018 - 2025

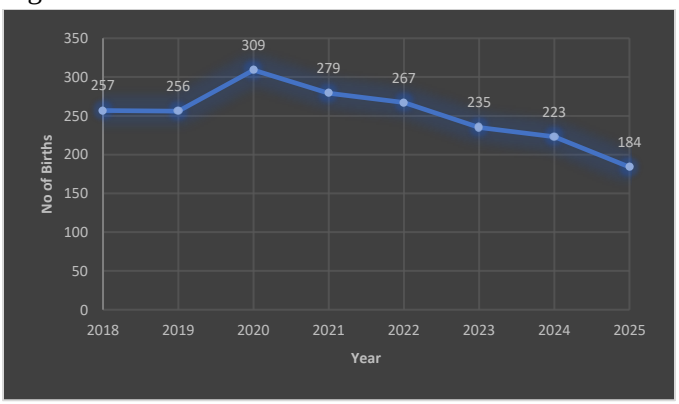

Figure 1B: Total Annual Births by Sex 2018 - 2025

- Total live births increased from 257 in 2018 to a peak of 309 in 2020, before declining steadily to 184 births in 2025, indicating an overall downward trend after 2020.
- Male births were higher than female births from 2018 to 2022, peaking at 167 births in 2020, while female births peaked at 142 births in the same year.
- From 2023 onwards, female births slightly exceeded male births, with 118 female vs 117 males in 2023, 114 vs 109 in 2024, and 101 vs 83 in 2025.

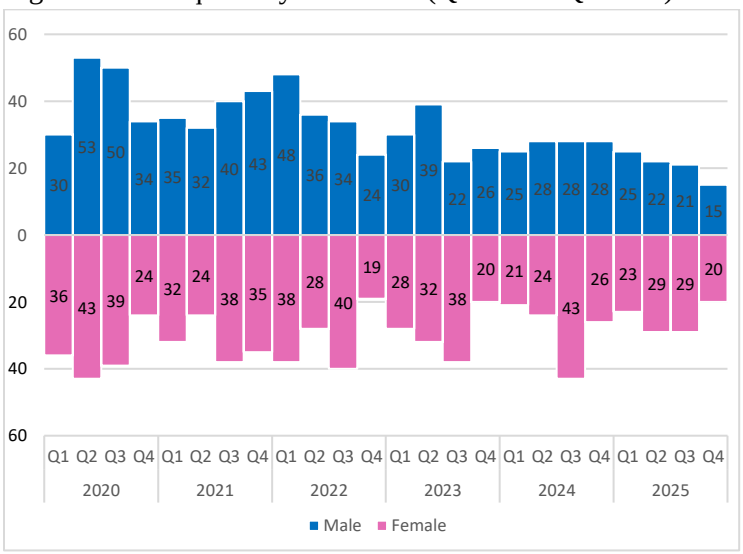
2. Quarterly Births Averages

Table 1: Average quarterly and annual births by Sex for the period from 2018 - 2025

	Males	Females	Total
Q1	33	29	**62**
Q2	36	31	**68**
Q3	35	34	**69**
Q4	29	24	**53**
Total	**133**	**119**	**251**

- The average annual number of live births during 2018–2025 was approximately 251. The average annual numbers of male and female births were approximately 133 and 119, respectively.
- Quarter 3 recorded the highest average number of births (69), followed closely by Quarter 2 (68), while Quarter 4 had the lowest average (53).
- Male births exceeded female births in all four quarters, with the largest difference observed in Quarter 2 and Quarter 4.

Figure 2: Total quarterly live births (Q1 2020 - Q4 2025)



- Quarterly live births fluctuated between 2020 and 2025, with the highest number recorded in Q2 2020 (96 births) and the lowest in Q4 2025 (35 births).
- Male births were generally higher than female births during 2020-2023, while female births exceeded male births in several quarters of 2024 and 2025, particularly Q3 2024 (43 females vs 28 males).
- Births showed a gradual decline over the reporting period, with quarterly totals becoming consistently lower in 2025 compared with earlier years.

3. Sex Ratio at Birth

Table 2: Total live births by Sex from 2018 to 2025.

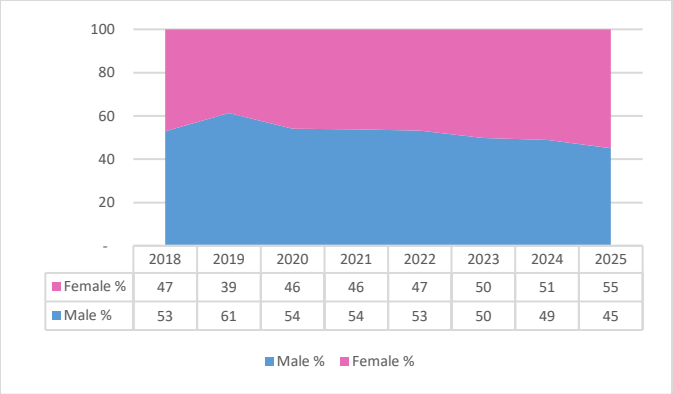
	Males	Females	Total	Sex Ratio
2018	136	121	**257**	112
2019	157	99	**256**	159
2020	167	142	**309**	118
2021	150	129	**279**	116
2022	142	125	**267**	114
2023	117	118	**235**	99

2024	109	114	**223**	96
2025	83	101	**184**	82

The Sex Ratio indicates the number of Males per 100 female births, the results show that;

- Total live births increased from 257 in 2018 to a peak of 309 in 2020, before declining to 184 births in 2025.
- Male births were higher than female births from 2018 to 2022, while female births slightly exceeded male births from 2023 onwards.
- The sex ratio declined from 159 males per 100 female births in 2019 to 82 males per 100 females in 2025, showing fewer male births in recent years.

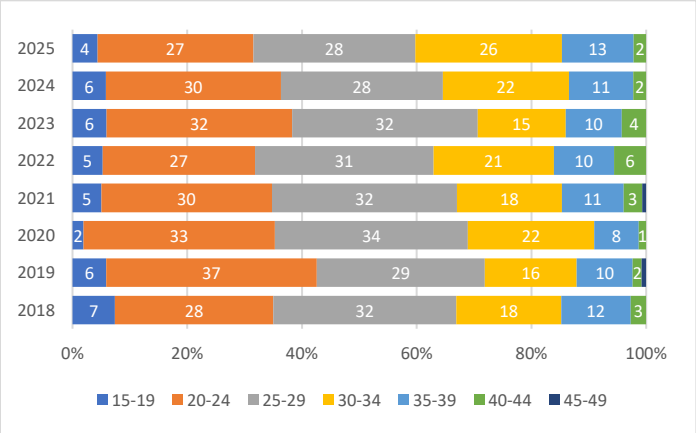
Figure 3: Sex proportion of live births (2018 – 2025)



- Male births made up a higher proportion of live births from 2018 to 2022, peaking at 61% in 2019.
- Female births gradually increased from 47% in 2018 to 55% in 2025.
- Male and female births were almost equal in 2023 (50% females and 50% males).

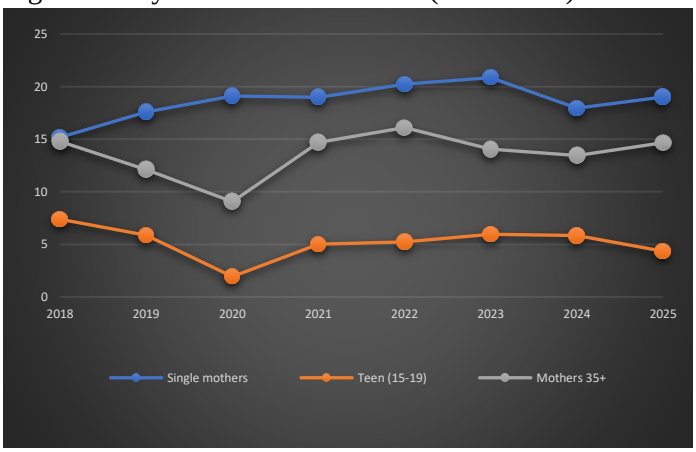
4. Births by Age Group of Mothers & Marital Status

Figure 4: Proportion of Mothers Age-Group (2018 - 2025)



- Mothers aged 25-29 years consistently recorded the highest proportion of births, ranging from 28% to 34%.
- Mothers aged 20-24 years were the second largest age group, contributing 27% to 37% of births.
- Teenage mothers (15-19 years) accounted for a relatively small proportion, ranging from 2% to 7%.

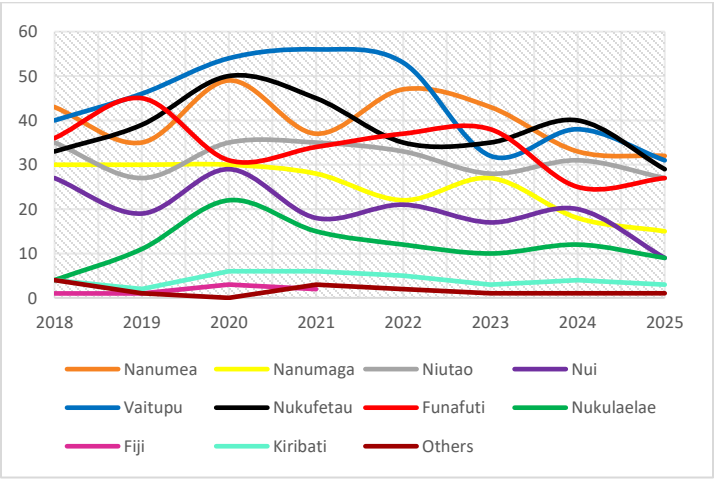
Figure 5: Key Statistics on Mothers (2018-2025)



- The proportion of **teenage pregnancy** (15-19 years) generally declined, falling from 7% in 2018 to 4% in 2025, despite small fluctuations.
- The proportion of births to **mothers aged 35+** fluctuated over the period, ranging from 9% to a high of 16% in 2022.
- The proportion of **Single mothers** showed a gradual increase over the reporting period, rising from 15% in 2018 to 19% in 2025.

5. Home Island of Mothers

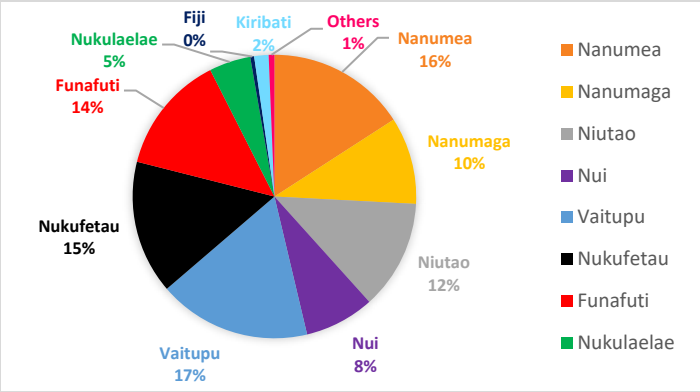
Figure 6: Trends of Mothers home-islands, 2018-2025



Trends in mothers' home islands (2018-2025) include:

- Vaitupu, Nukufetau, Funafuti and Nanumea consistently recorded the highest number of mothers throughout 2018-2025.
- Mothers from Nukulaelae and Other countries including Kiribati and Fijian recorded the lowest births each year.

Figure 7: Share of Mothers Home Islands from 2018 to 2025.

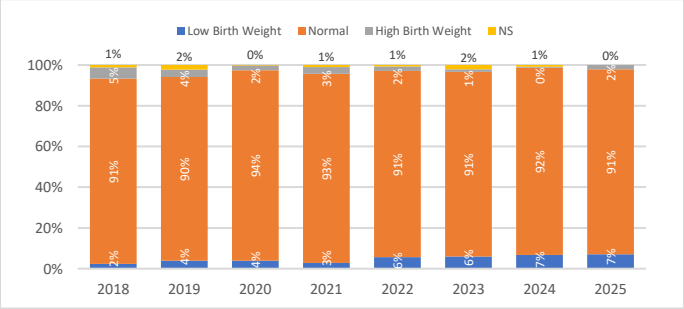


From 2018 to 2025:

- Vaitupu recorded the largest share of mothers (17%), followed by Nanumea (16%), Nukufetau (15%), and Funafuti (14%).
- Nukulaelae contributed a smaller share (5%) compared with the larger islands.
- Approx 3% of mothers that gave birth within this period are from other countries outside of Tuvalu.

6. Newborn Weight Distribution

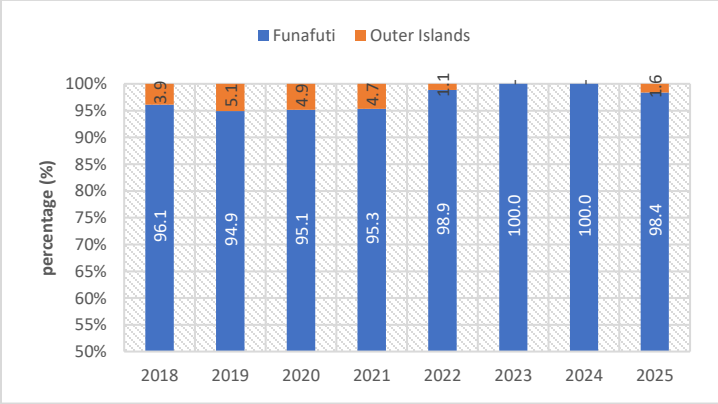
Figure 8: Infant Birth Weight Classes (2018 – 2025)



- Normal birth weight recorded the overwhelmingly largest share of infants (92%) across the 2018-2025 period.
- Low birth weight contributed a much smaller share (5%) compared with the normal baseline range.
- High birth weight (3%) and NS (1%) accounted for only a minimal proportion.

7. Island of Birth

Figure 9: Proportion of births occurring on Funafuti vs Outer islands



- Funafuti accounted for 94.9% to 100% of all registered births during 2018-2025, making it the main place of childbirth.
- Births in the outer islands ranged from 0% to 5%, representing only a small proportion of total births.
- No births were recorded in the outer islands during 2023 and 2024, with all births occurring in Funafuti.

2. Mortality

1. Comparisons of Annual Mortalities Trends

Figure 10A: Total Annual Deaths 2017 - 2025

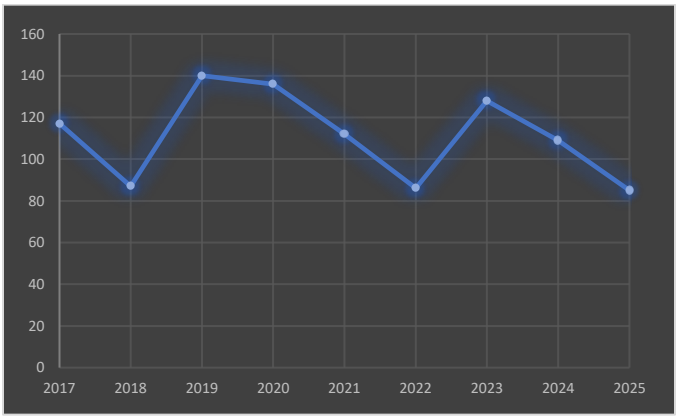


Figure 10B: Total Annual Deaths by Sex 2017 - 2025

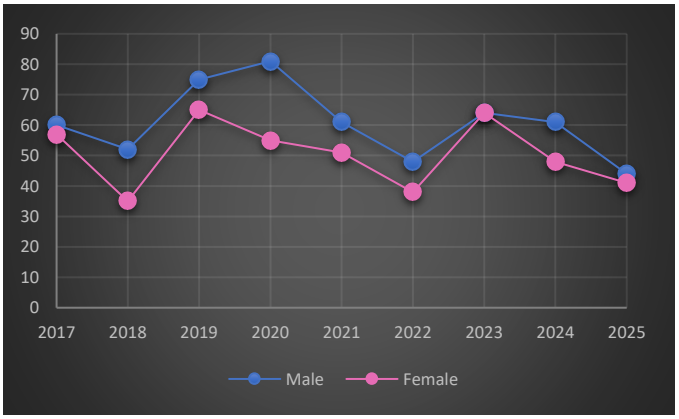


- Total deaths showed a fluctuating pattern over the 9-year period, peaking at a high of 140 in 2019 and dropping to a low of 85 in 2025.
- Male deaths reached their highest level in 2020 (81 deaths), while female deaths peaked in 2019 (65 deaths).
- Male and female deaths were equal in 2023, with 64 deaths each, showing the smallest difference between the sexes.
- Both male and female deaths declined by 2025, suggesting an overall decrease in mortality compared to earlier years.

2. Quarterly Mortality Averages

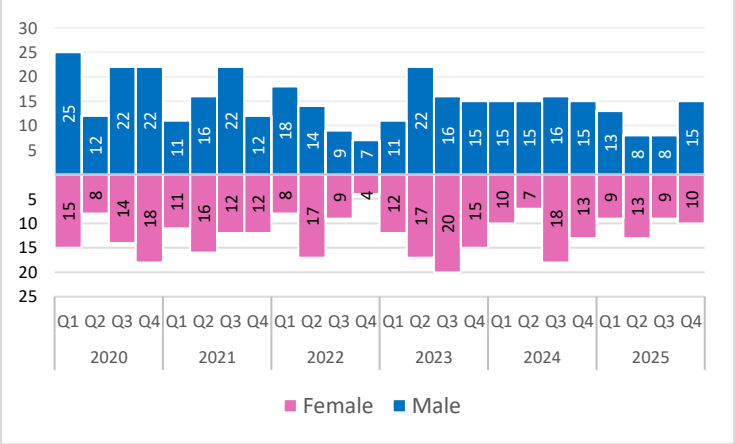
Table 3: Average quarterly and annual deaths by Sex for the Years 2017 - 2025.

	Males	Females	Total
Q1	16	12	**28**
Q2	15	13	**28**
Q3	14	14	**28**
Q4	16	12	**28**
Total	**61**	**50**	**111**

In the 9-year period between 2017 and 2025;

- The average annual number of deaths is around 111, with an average of about 61 male deaths and 50 female deaths.
- The average number of deaths remained consistent across all four quarters, averaging approximately 28 deaths per quarter.
- Male deaths were higher than female deaths in Q1, Q2, and Q4, while Q3 recorded an equal average of 14 male and 14 female deaths.

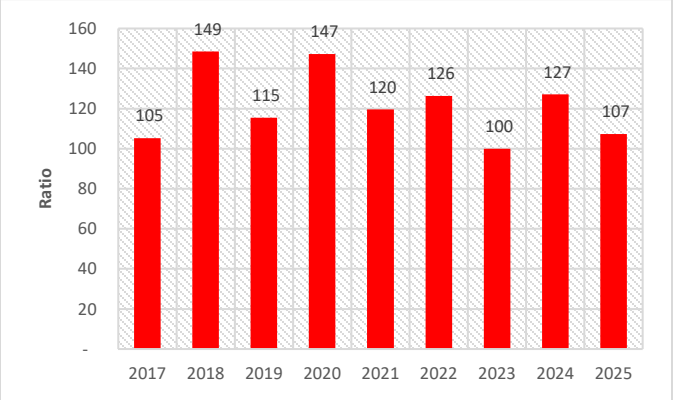
Figure 11: Total quarterly deaths (Q1 2020 - Q4 2025)



- Deaths in Q4 2025 decreased by 10.7% compared with Q4 2024.
- The highest quarterly mortality rate in the six-year period occurred in Q1 and Q4 of 2020, each recording 40 deaths.
- The lowest quarterly total was Q4 2022, with only 11 deaths.
- Q2 2025 shows an atypical pattern, with female deaths (13) exceeding male deaths (8), contrary to historical trends.

3. Mortality Sex Ratio

Figure 12: Mortality Sex Ratio from 2017 to 2025.

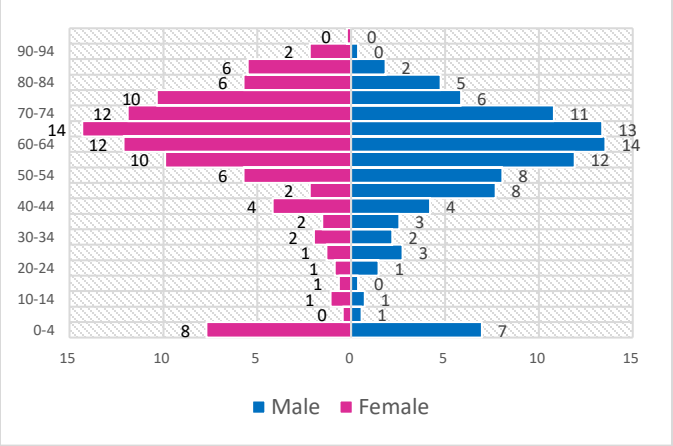


Mortality sex ratio = Male deaths per 100 female deaths

- The mortality sex ratio fluctuated throughout 2017 to 2025, ranging from 100 male deaths per 100 female deaths in 2023 to 149 in 2018.
- The high ratios in 2018 and 2020 indicate substantially more male deaths than female deaths in those years.
- The ratio declined to 100 in 2023, increased to 127 in 2024, and decreased to 107 in 2025.

4. Deaths by Age Group and Sex

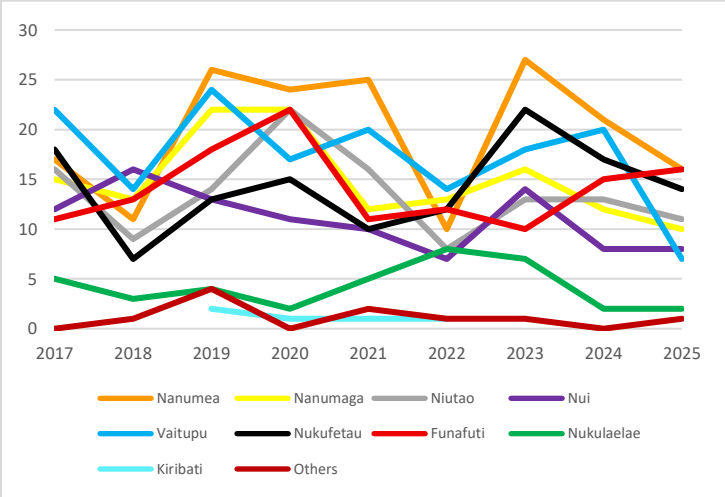
Figure 13: Comparison of percentage deaths by age-group and sex from 2017-2025.



- The distribution of deaths varied by age and sex, with relatively high proportions recorded among older adults aged 60 to 69 years.
- The 60 to 64 age group accounted for approximately 14% of male deaths and 12% of female deaths, while the 65 to 69 age group accounted for approximately 13% of male deaths and 14% of female deaths.
- The age group 0 to 4 years accounted for a notable proportion of recorded deaths, representing approximately 7% of all male deaths and 8% of all female deaths. This highlights the vulnerability of children under five and the importance of continued efforts to improve child health and reduce preventable deaths.

5. Deaths by Home Island

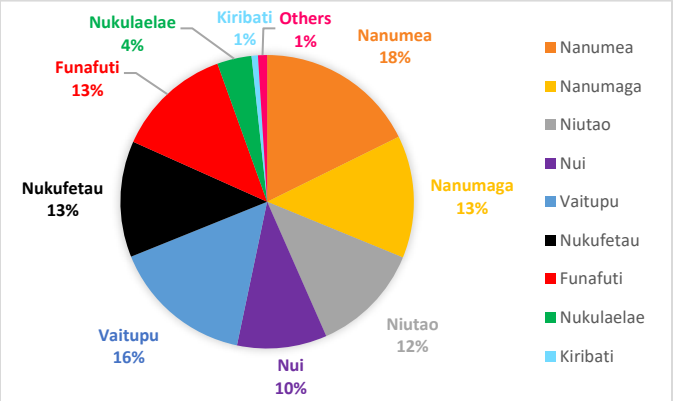
Figure 14: Mortality trend by Home-island from 2017-2025.



Trends in home islands of recorded deaths (2017–2025) include:

- Nanumea, Vaitupu, Niutao, and Nukufetau generally recorded the highest number of deaths during 2017-2025, although the numbers fluctuated from year to year.
- Nanumea recorded the highest number of deaths in 2023 (27 deaths), while Vaitupu peaked in 2019 (24 deaths).
- Kiribati, others, and Nukulaelae consistently recorded the lowest number of deaths, with fewer than 10 deaths in most years.

Figure 15: Average recorded deaths per Home Islands for 2017 to 2025.

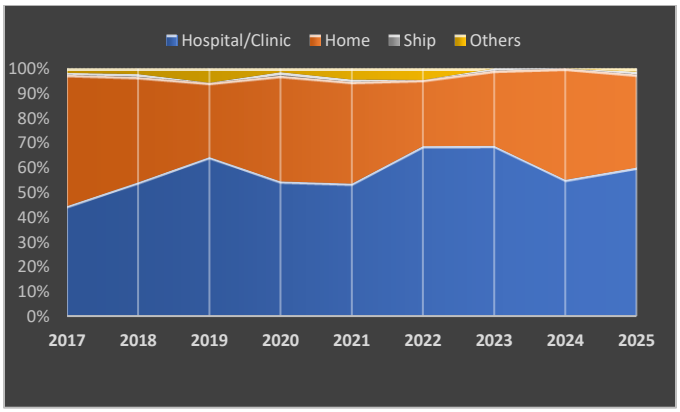


From 2017 to 2025:

- Nanumea recorded the highest share of deaths (18%), followed by Vaitupu (16%).
- Nanumaga, Nukufetau, and Funafuti each contributed about 13% of the total deaths.
- Kiribati and other countries recorded the lowest average share, with 1% each.

6. Place of Death

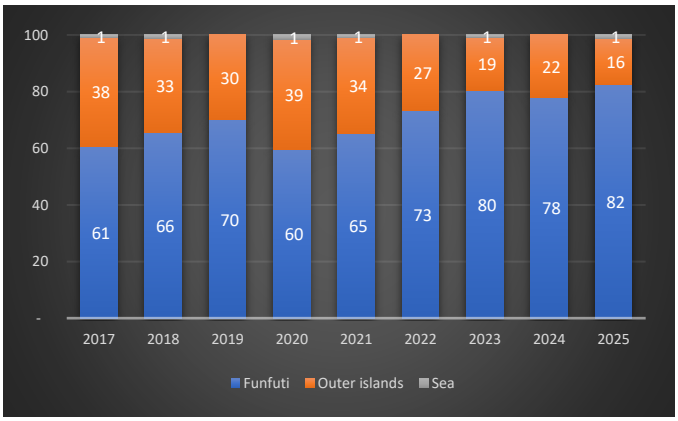
Figure 16: Proportion of Reported Place of Deaths 2017-2025.



- In 2017, more deaths occurred at home (53%) than in hospitals or clinics (44%).
- The highest hospital or clinic deaths were recorded in 2022 and 2023, accounting for 69% of deaths
- Home deaths increased in 2024 before declining in 2025, while hospitals and clinics remained the main place of death.

7. Deaths by Island of Occurrence

Figure 17: Proportion of Deaths for Funafuti, Outer Islands and Sea from 2017-2025

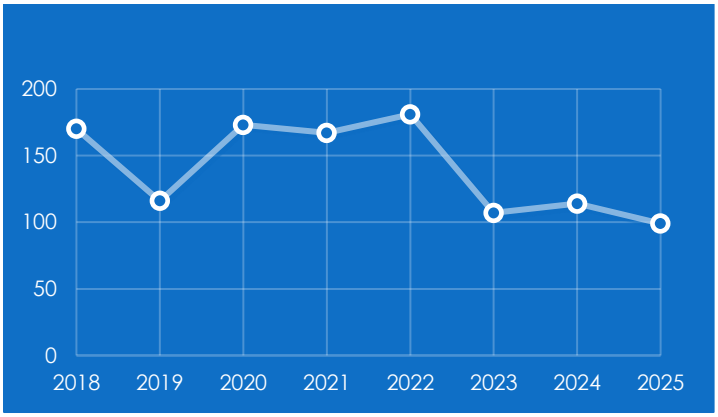


- Funafuti recorded the highest number of deaths throughout 2017 to 2025, averaging approximately 78 deaths per year, equivalent to around 70% of all recorded deaths.
- The outer islands averaged approximately 32 deaths per year, accounting for around 29% of deaths.
- Deaths occurring at sea were rare, averaging approximately one death per year.

3. Key Vital Statistics Indicators

1. Natural Increase

Figure 18: Natural Increase trend from 2018- 2025



- Over the past eight years, Tuvalu's natural increase has remained positive, indicating that the number of births consistently exceeded the number of deaths each year.
- Natural increases fluctuated over the reporting period, reaching a peak of 181 added population in 2022 before declining to a low of 99 in 2025, reflecting annual changes in births and deaths.

2. Sex Specific & Total Infant Mortality Rate

Table 4: Infant mortality rate from 2018 to 2025 disaggregated by Sex;

	Sex Specific IMR		IMR
	Males	Females	Total
2018	37	33	35
2019	38	71	51
2020	18	42	29
2021	7	16	11
2022	7	8	7
2023	17	17	17
2024	46	18	31
2025	24	10	16

The figures in the table are interpreted as;

- The overall Infant Mortality Rate (IMR) fluctuated between 2018 and 2025, with the highest rate recorded in 2019 (51 per 1,000 live births) and the lowest in 2022 (7 per 1,000 live births).
- Female IMR was highest in 2019 (71), while male IMR peaked in 2024 (46).
- The overall IMR declined from 35 in 2018 to 16 in 2025, despite an increase in 2024 (31).

4. Technical Notes

1. Sex Ratio

The sex ratio formula calculates the proportion of males to females in a population;

$$Sex\ Ratio = \frac{Number\ of\ Males}{Number\ of\ Females} \times 100$$

representing males per 100 females.

2. Percentage Birth Weight Classes

Weights were divided into 4 different weight groups[1];

Weight Classes	Weight Range
Very Low Birth Weight	< 1.5kg
Low Birth Weight	1.5 - 2.49kg
Normal	2.5 - 4.49kg
High Birth Weight	≥ 4.5kg

$$Weight\ Class\ \% = \frac{Number\ of\ Births\ within\ Range}{Total\ Number\ of\ Births} \times 100$$

3. Infant Mortality Rate

The infant mortality rate (IMR) formula calculates deaths per 1,000 live births;

$$IMR = \frac{Number\ of\ Infant\ Deaths}{Number\ of\ Live\ Births} \times 1{,}000$$

where infant deaths are babies dying before their first birthday in a specific year and location.
